Integration of Nondeterminism with Design Principles. Image “Spectrum”.

The design principles in the image “Spectrum” are the squares of different size and color. The size is arranged so that every square is on the background of the previous one. The color is random.

Nondeterminism is incorporated through colors. Every time the program of the image is entered, the colors will be different.

This image is good to look at and explore the limits of your fantasy. At first glance it seems simple and flat, all you see is squares piled together. But in a moment your mind starts seeing different pictures hidden in it. You could imagine that you are on the bottom of the pyramid building and you look at its top up above. Also, it starts feeling like a 2-D object, which you can touch and feel the edges. Another image that is hidden here is a tunnel going far in front of you. Such images make us think and I think it is important.
