Design Principles and Non-Determinism

Design principles

Create rows of painted circles. Each circle with vary in color and size.

Non-determinism

This image consists of circles varying in color and size. The circles are irregularly spaced as a result of the varying circle sizes. The size of the dots and the color are chosen randomly in accordance with the program that I wrote.

Image description

Most of the colors in this image are bright and cheerful. The way the circles are positioned reminds me of bubbles floating together, some overlapping. The overlapping circles create a design that pops out of the page and gives the image a three dimensional feel. The lighter colored dots are smaller than the rest and appear to be in the background.
