

Candidate Research Problem Statement #2

Using Concept Mapping and Modeling to Explain and Explore Techniques of Human Foraging

I am studying how concept maps and models can be used to study and better understand human foraging **because I want to find out** if humans use the same techniques when physically searching for an object, when mentally foraging through memories and experiences **in order to help my reader better understand** the techniques humans use when performing mental and physical foraging and how concept mapping and modeling can be used to help explore human foraging techniques, both physically and mentally.
