AI in the movies: What makes us human.

1. This video looks at AI in movies to see how humans are different from machines.
2. The video takes a theatrical approach to looking at the shortcomings of AI by looking at what makes humans human. One big point is that humans have emotions and while some of the movie's AI can try to mimic emotion, it is a way to tell humans from machines. This is relevant to this class because one goal of computational cognitive science is to model human processing; to do that well, one might want to consider representing emotion as well. Along those lines of emotion, another thing that AI comes short on is experience. You can train an algorithm with past data, but it does not have the same type of episodic memory that comes with the idea of self. In the video, a point that was made about accounting for the situation by implanting false memories, but it is not the same as the memories that humans have.
3. I would give this video a 4 because the video talks about the shortcomings of AI by saying what it doesn't have in comparison to humans, but it does not acknowledge its strengths and where humans are in the mix and can be a bit slow in some parts.
